# Chapter 3 Transport Layer

# Computer Networking: A Top-Down Approach

8<sup>th</sup> edition Jim Kurose, Keith Ross Pearson, 2020

## Chapter 3: roadmap

- Transport-layer services
- Multiplexing and demultiplexing
- Connectionless transport: UDP
- Connection-oriented transport: TCP
  - segment structure
  - reliable data transfer
  - flow control
  - connection management
- Principles of congestion control
- TCP congestion control

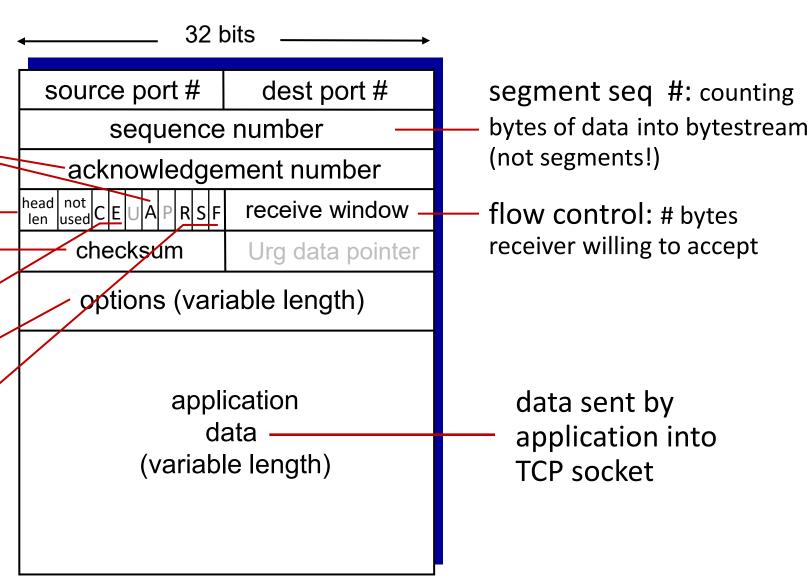

## TCP: overview RFCs: 793,1122, 2018, 5681, 7323

- point-to-point:
  - one sender, one receiver
- reliable, in-order byte steam:
  - no "message boundaries"
- full duplex data:
  - bi-directional data flow in same connection
  - MSS: maximum segment size

- cumulative ACKs
- pipelining:
  - TCP congestion and flow control set window size
- connection-oriented:
  - handshaking (exchange of control messages) initializes sender, receiver state before data exchange
- flow controlled:
  - sender will not overwhelm receiver

# TCP segment structure

ACK: seq # of next expected byte; A bit: this is an ACK length (of TCP header) Internet checksum C, E: congestion notification TCP options RST, SYN, FIN: connection management

# TCP sequence numbers, ACKs

#### Sequence numbers:

 byte stream "number" of first byte in segment's data

#### Acknowledgements:

- seq # of next byte expected from other side
- cumulative ACK

Q: how receiver handles out-oforder segments

 A: TCP spec doesn't say, - up to implementor

sender sequence number space

sent sent, not- usable not yet ACKed but not usable ("in-flight") yet sent

outgoing segment from receiver

source port#		dest port #
sequence number		
acknowledgement number		
	A	rwnd
checksum		urg pointer

# TCP round trip time, timeout

- Q: how to set TCP timeout value?
- longer than RTT, but RTT varies!
- too short: premature timeout, unnecessary retransmissions
- too long: slow reaction to segment loss

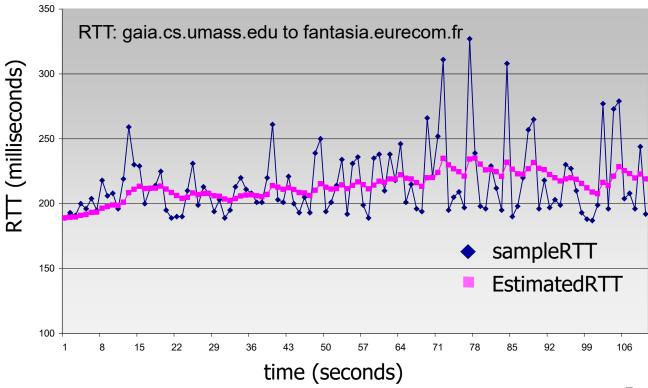

#### Q: how to estimate RTT?

- SampleRTT: measured time from segment transmission until ACK receipt
  - ignore retransmissions
- SampleRTT will vary, want estimated RTT "smoother"
  - average several recent measurements, not just current SampleRTT

# TCP round trip time, timeout

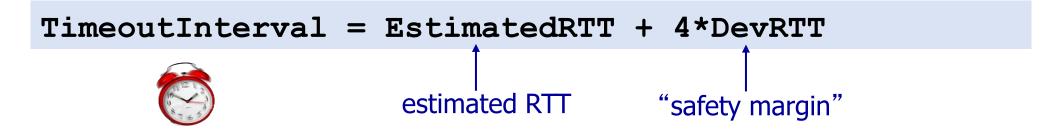

EstimatedRTT =  $(1-\alpha)$ \*EstimatedRTT +  $\alpha$ \*SampleRTT

- <u>e</u>xponential <u>w</u>eighted <u>m</u>oving <u>a</u>verage (EWMA)
- influence of past sample decreases exponentially fast
- typical value:  $\alpha$  = 0.125

# TCP round trip time, timeout

- timeout interval: EstimatedRTT plus "safety margin"
  - large variation in EstimatedRTT: want a larger safety margin

DevRTT: EWMA of SampleRTT deviation from EstimatedRTT:

DevRTT = 
$$(1-\beta)$$
\*DevRTT +  $\beta$ \*|SampleRTT-EstimatedRTT|

(typically,  $\beta = 0.25$ )

<sup>\*</sup> Check out the online interactive exercises for more examples: http://gaia.cs.umass.edu/kurose\_ross/interactive/

# TCP Sender (simplified)

# event: data received from application

- create segment with seq #
- seq # is byte-stream number of first data byte in segment
- start timer if not already running
  - think of timer as for oldest unACKed segment
  - expiration interval:TimeOutInterval

#### event: timeout

- retransmit segment that caused timeout
- restart timer

#### event: ACK received

- if ACK acknowledges previously unACKed segments
  - update what is known to be ACKed
  - start timer if there are still unACKed segments

# TCP Receiver: ACK generation [RFC 5681]

#### Event at receiver

arrival of in-order segment with expected seq #. All data up to expected seq # already ACKed

arrival of in-order segment with expected seq #. One other segment has ACK pending

arrival of out-of-order segment higher-than-expect seq. # . Gap detected

#### TCP receiver action

delayed ACK. Wait up to 500ms for next segment. If no next segment, send ACK

immediately send single cumulative ACK, ACKing both in-order segments

immediately send *duplicate ACK*, indicating seq. # of next expected byte

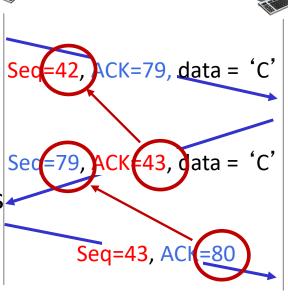

# TCP sequence numbers, ACKs

Host A

1. User types 'C'.
HostA sends Seq# 42
(1 Byte), and expects
the next received

Seq# to be 79

3. HostA receives Seq# 79 (1 Byte), and expects the next received Seq# to be 80. It sends another Byte, with Seq# 43 (1 Byte)

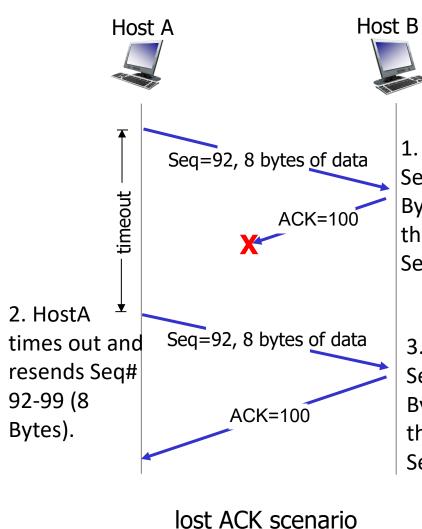

2. HostB receives Seq#
42 (1 Byte), ACKs
receipt of 'C', and
expects the next
received Seq# to be 43.
It echoes back 'C', with
Seq# 79 (1 Byte)

Host B

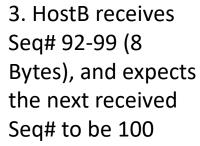

simple telnet scenario

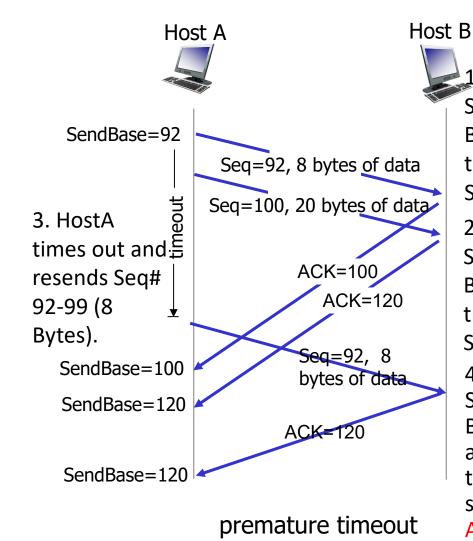

## TCP: retransmission scenarios

1. HostB receives
Seq# 92-99 (8
Bytes), and expects
the next received
Seq# to be 100

HostB receives Seq# 92-99 (8 Bytes), and expects the next received Seq# to be 100 2. HostB receives Seq# 100-119 (20 Bytes), and expects the next received Seq# to be 120 4. HostB receives Seq# 92-99 (8 Bytes). But it has already received up to Seg# 119, so it

sends cumulative

ACK for Seq# 120

## TCP: retransmission scenarios

Host B

Seq=92, 8 bytes of data Seq=100, 20 bytes of data 3. HostA receives ACK=100 ACK for Seq# 120. This cumulative ACK ACK=120 of Seq# 120 covers for earlier lost ACK Seg# to be 120 of Seg#100, so

Seq=120, 15 bytes of data

Host A

HostA knows that

all bytes up to

HostB has received

Seq#119, so it can

Bytes (Seq#120-134).

send the next 15

1. HostB receives Seg# 92-99 (8 Bytes), and expects the next received Seq# to be 100, but the ACK is lost. 2. HostB receives Seq# 100-119 (20 Bytes), and expects the next received

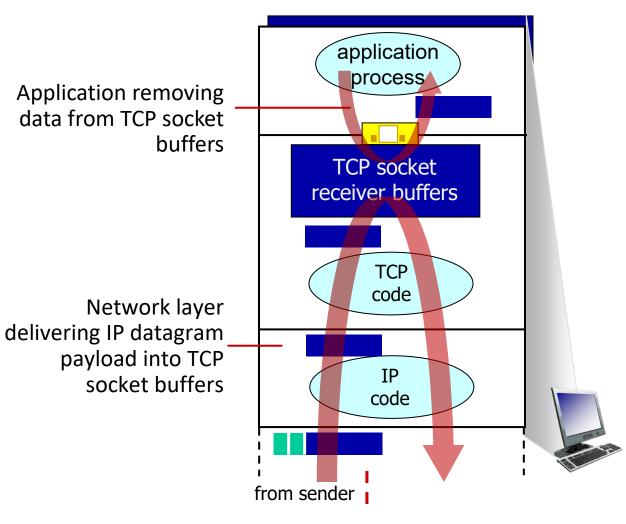

- Q: what happens if the segment with Seq=92, 8 bytes of data from Host A to Host B gets lost?
- A: Host B will NOT send ACK=120, since a cumulative ACK=120 implies that all previous segments with Seq < 120 have been received

## Chapter 3: roadmap

- Transport-layer services
- Multiplexing and demultiplexing
- Connectionless transport: UDP
- Principles of reliable data transfer
- Connection-oriented transport: TCP
  - segment structure
  - reliable data transfer
  - flow control
  - connection management
- Principles of congestion control
- TCP congestion control

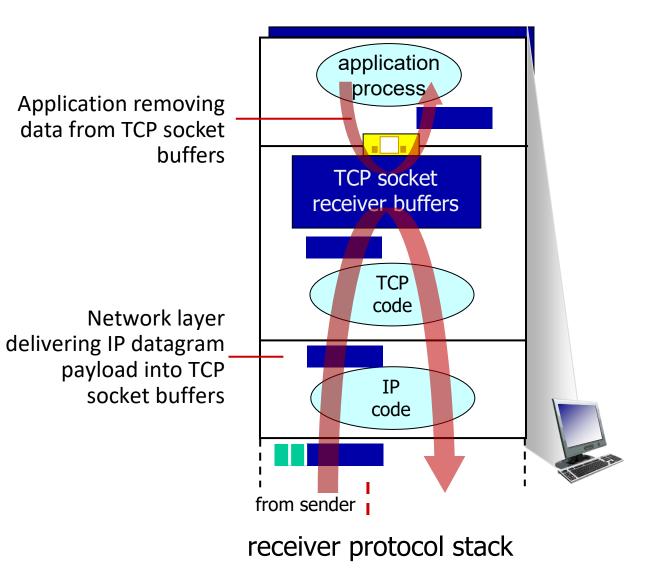

Q: What happens if network layer delivers data faster than application layer removes data from socket buffers?

receiver protocol stack

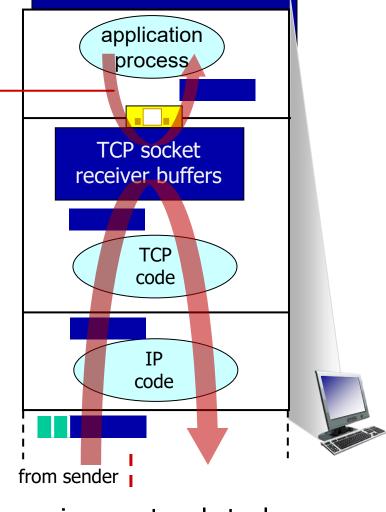

Q: What happens if network layer delivers data faster than application layer removes data from socket buffers?

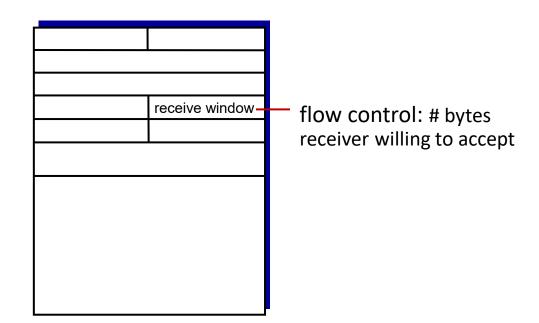

Q: What happens if network layer delivers data faster than application layer removes data from socket buffers?

Application removing data from TCP socket buffers

receiver protocol stack

Q: What happens if network layer delivers data faster than application layer removes data from socket buffers?

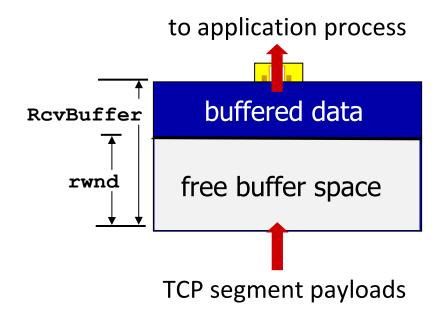

#### -flow control

receiver controls sender, so sender won't overflow receiver's buffer by transmitting too much, too fast

application process Application removing data from TCP socket buffers TCP socket receiver buffers **TCP** code code from sender

receiver protocol stack

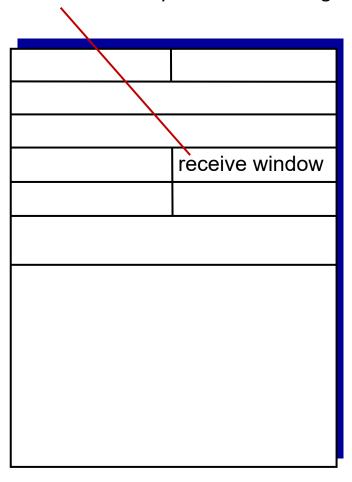

- TCP receiver "advertises" free buffer space in rwnd field in TCP header
  - RcvBuffer size set via socket options (typical default is 4096 bytes)
  - many operating systems auto-adjust
     RcvBuffer
- sender limits amount of unACKed ("in-flight") data to received rwnd
- guarantees receive buffer will not overflow

TCP receiver-side buffering

- TCP receiver "advertises" free buffer space in rwnd field in TCP header
  - RcvBuffer size set via socket options (typical default is 4096 bytes)
  - many operating systems auto-adjust
     RcvBuffer
- sender limits amount of unACKed ("in-flight") data to received rwnd
- guarantees receive buffer will not overflow

flow control: # bytes receiver willing to accept

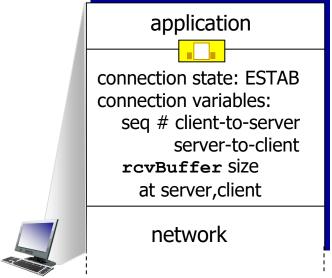

TCP segment format

# TCP connection management

before exchanging data, sender/receiver "handshake":

- agree to establish connection (each knowing the other willing to establish connection)
- agree on connection parameters (e.g., starting seq #s)

```
network

Socket clientSocket =
newSocket("hostname", "port number");
```

```
application

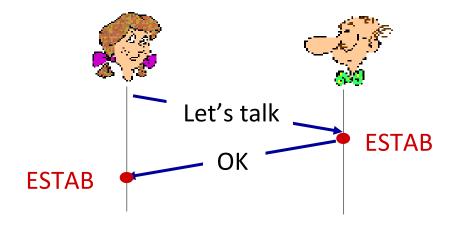

connection state: ESTAB
connection Variables:
  seq # client-to-server
      server-to-client
  rcvBuffer size
  at server,client

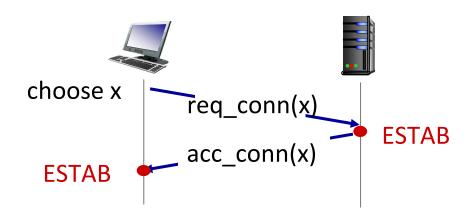

network
```

```
Socket connectionSocket =
  welcomeSocket.accept();
```

# Agreeing to establish a connection

#### 2-way handshake:

Q: will 2-way handshake always work in network?

- variable delays
- retransmitted messages (e.g. req\_conn(x)) due to message loss
- message reordering
- can't "see" other side

# TCP 3-way handshake

#### Client state

clientSocket = socket(AF INET, SOCK STREAM)

#### LISTEN

clientSocket.connect((serverName, serverPort)

choose init seq num, x send TCP SYN msq **SYNSFNT** 

**ESTAB** 

received SYNACK(x) indicates server is live;

send ACK for SYNACK; this segment may contain client-to-server data

SYNbit=1, Seq=y ACKbit=1; ACKnum=x+1

SYNbit=1, Seq=x

ACKbit=1, ACKnum=y+1

1. It allows both parties to synchronize their sequence numbers

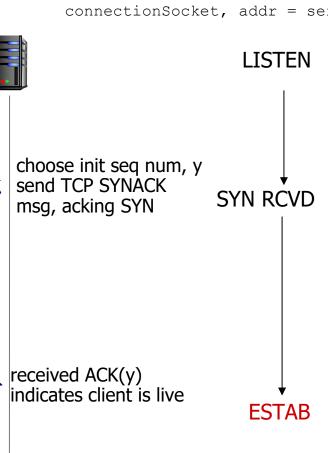

- 2. Confirm that both sides are ready for data transfer
- 3. Agree on initial parameters for the connection

Server state

serverSocket = socket(AF INET, SOCK STREAM) serverSocket.bind(('', serverPort))

serverSocket.listen(1)

connectionSocket, addr = serverSocket.accept()

# A human 3-way handshake protocol

# Closing a TCP connection

- client, server each close their side of connection
  - send TCP segment with FIN bit = 1
- respond to received FIN with ACK
  - on receiving FIN, ACK can be combined with own FIN
- simultaneous FIN exchanges can be handled
