# Chapter 3 Transport Layer

# Computer Networking: A Top-Down Approach

8<sup>th</sup> edition Jim Kurose, Keith Ross Pearson, 2020

## Chapter 3: roadmap

- Transport-layer services
- Multiplexing and demultiplexing
- Connectionless transport: UDP
- Principles of reliable data transfer
- Connection-oriented transport: TCP
  - segment structure
  - reliable data transfer
  - flow control
  - connection management
- Principles of congestion control
- TCP congestion control

## **TCP: overview** RFCs: 793,1122, 2018, 5681, 7323

- point-to-point:
  - one sender, one receiver
- reliable, in-order byte steam:
  - no "message boundaries"
- full duplex data:
  - bi-directional data flow in same connection
  - MSS: maximum segment size

- cumulative ACKs
- pipelining:
  - TCP congestion and flow control set window size
- connection-oriented:
  - handshaking (exchange of control messages) initializes sender, receiver state before data exchange
- flow controlled:
  - sender will not overwhelm receiver

## TCP segment structure

32 bits source port # dest port # segment seq #: counting ACK: seq # of next expected bytes of data into bytestream sequence number byte; A bit: this is an ACK (not segments!) acknowledgement number head not len used C E length (of TCP header) receive window flow control: # bytes Internet checksum receiver willing to accept checksum Urg data pointer options (variable length) C, E: congestion notification TCP options application data sent by RST, SYN, FIN: connection data application into management (variable length) TCP socket

# TCP sequence numbers, ACKs

#### Sequence numbers:

 byte stream "number" of first byte in segment's data

#### Acknowledgements:

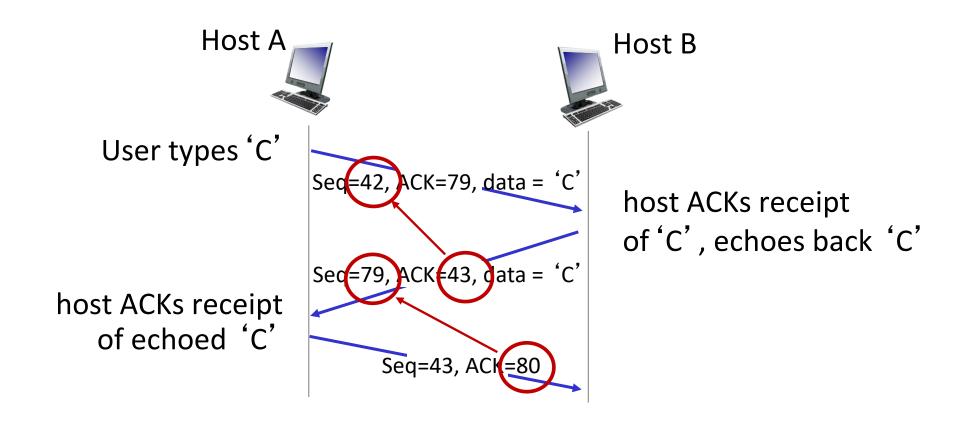

- seq # of next byte expected from other side
- cumulative ACK

Q: how receiver handles out-oforder segments

 A: TCP spec doesn't say, - up to implementor

# TCP sequence numbers, ACKs

simple telnet scenario

# TCP round trip time, timeout

- Q: how to set TCP timeout value?
- longer than RTT, but RTT varies!
- too short: premature timeout, unnecessary retransmissions
- too long: slow reaction to segment loss

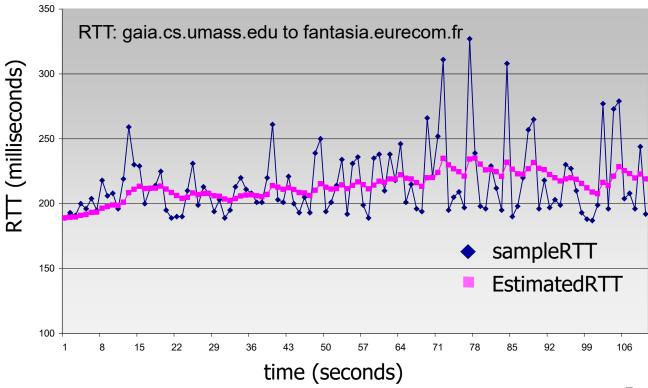

#### Q: how to estimate RTT?

- SampleRTT: measured time from segment transmission until ACK receipt
  - ignore retransmissions
- SampleRTT will vary, want estimated RTT "smoother"
  - average several recent measurements, not just current SampleRTT

# TCP round trip time, timeout

EstimatedRTT =  $(1-\alpha)$ \*EstimatedRTT +  $\alpha$ \*SampleRTT

- <u>e</u>xponential <u>w</u>eighted <u>m</u>oving <u>a</u>verage (EWMA)
- influence of past sample decreases exponentially fast
- typical value:  $\alpha$  = 0.125

# TCP round trip time, timeout

- timeout interval: EstimatedRTT plus "safety margin"
  - large variation in EstimatedRTT: want a larger safety margin

DevRTT: EWMA of SampleRTT deviation from EstimatedRTT:

DevRTT = 
$$(1-\beta)$$
\*DevRTT +  $\beta$ \*|SampleRTT-EstimatedRTT|

(typically,  $\beta = 0.25$ )

<sup>\*</sup> Check out the online interactive exercises for more examples: http://gaia.cs.umass.edu/kurose\_ross/interactive/

## TCP Sender (simplified)

# event: data received from application

- create segment with seq #
- seq # is byte-stream number of first data byte in segment
- start timer if not already running
  - think of timer as for oldest unACKed segment
  - expiration interval:TimeOutInterval

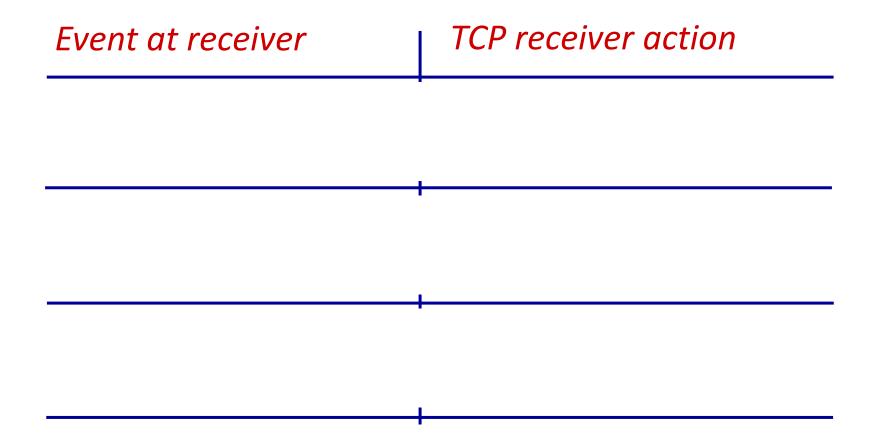

#### event: timeout

- retransmit segment that caused timeout
- restart timer

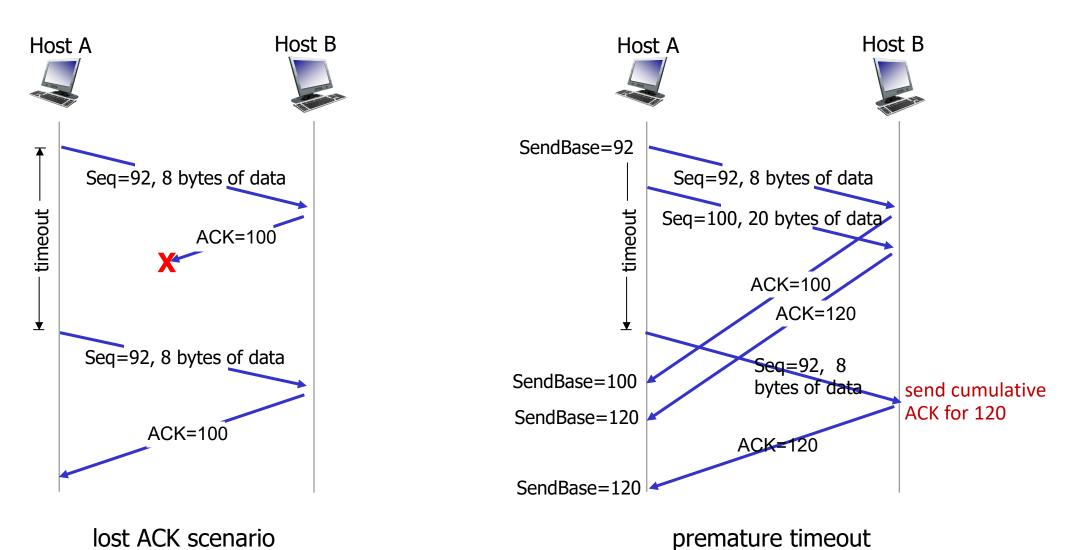

#### event: ACK received

- if ACK acknowledges previously unACKed segments
  - update what is known to be ACKed
  - start timer if there are still unACKed segments

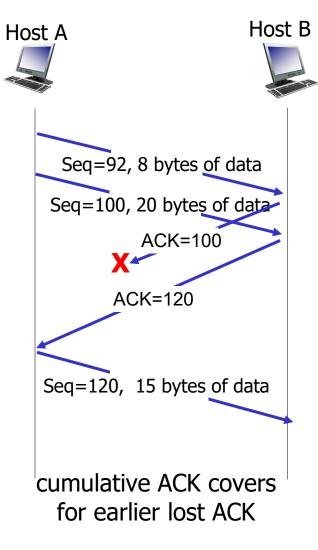

## TCP Receiver: ACK generation [RFC 5681]

### TCP: retransmission scenarios

### TCP: retransmission scenarios

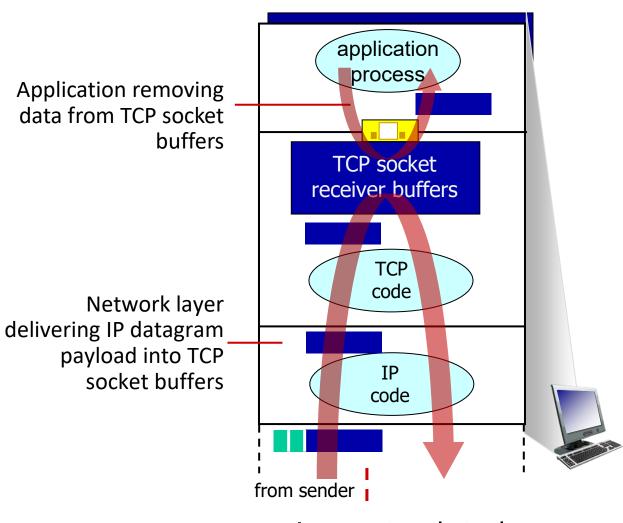

## Chapter 3: roadmap

- Transport-layer services
- Multiplexing and demultiplexing
- Connectionless transport: UDP
- Principles of reliable data transfer
- Connection-oriented transport: TCP
  - segment structure
  - reliable data transfer
  - flow control
  - connection management
- Principles of congestion control
- TCP congestion control

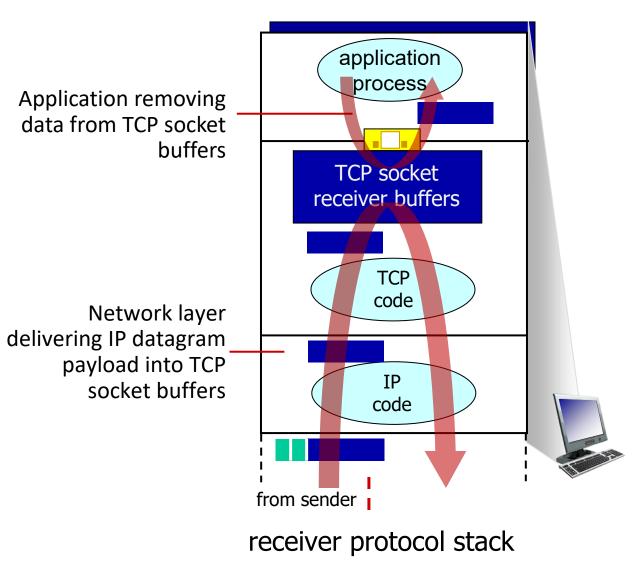

Q: What happens if network layer delivers data faster than application layer removes data from socket buffers?

receiver protocol stack

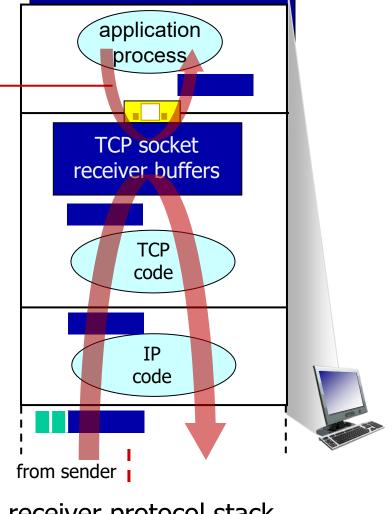

Q: What happens if network layer delivers data faster than application layer removes data from socket buffers?

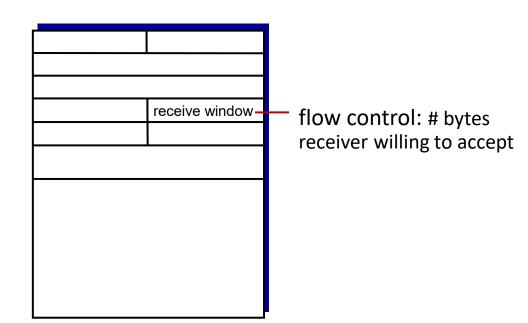

Q: What happens if network layer delivers data faster than application layer removes data from socket buffers?

Application removing data from TCP socket buffers

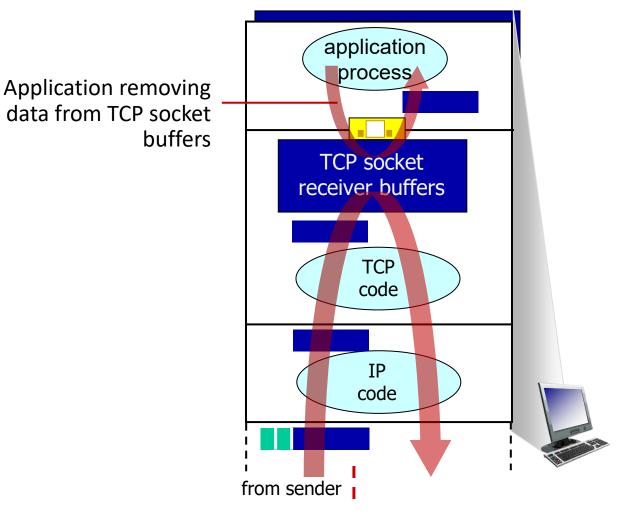

receiver protocol stack

Q: What happens if network layer delivers data faster than application layer removes data from socket buffers?

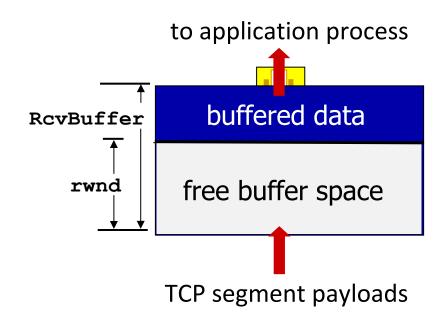

#### -flow control

receiver controls sender, so sender won't overflow receiver's buffer by transmitting too much, too fast

receiver protocol stack

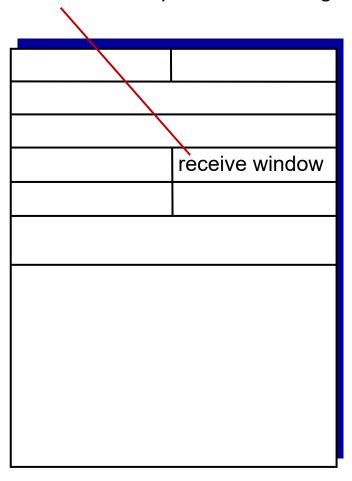

- TCP receiver "advertises" free buffer space in rwnd field in TCP header
  - RcvBuffer size set via socket options (typical default is 4096 bytes)
  - many operating systems auto-adjust
     RcvBuffer
- sender limits amount of unACKed ("in-flight") data to received rwnd
- guarantees receive buffer will not overflow

TCP receiver-side buffering

- TCP receiver "advertises" free buffer space in rwnd field in TCP header
  - RcvBuffer size set via socket options (typical default is 4096 bytes)
  - many operating systems auto-adjust
     RcvBuffer
- sender limits amount of unACKed ("in-flight") data to received rwnd
- guarantees receive buffer will not overflow

flow control: # bytes receiver willing to accept

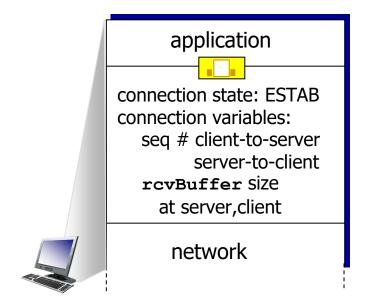

TCP segment format

## TCP connection management

before exchanging data, sender/receiver "handshake":

- agree to establish connection (each knowing the other willing to establish connection)
- agree on connection parameters (e.g., starting seq #s)

```
application

connection state: ESTAB
connection Variables:
  seq # client-to-server
      server-to-client
  rcvBuffer size
  at server,client

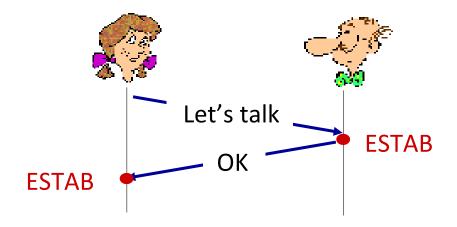

network
```

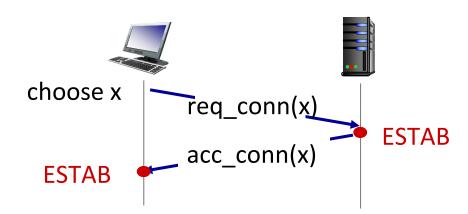

```
Socket clientSocket = Socket
newSocket("hostname","port number"); we]
```

```
Socket connectionSocket =
  welcomeSocket.accept();
```

## Agreeing to establish a connection

#### 2-way handshake:

**Q**: will 2-way handshake always work in network?

- variable delays
- retransmitted messages (e.g. req\_conn(x)) due to message loss
- message reordering
- can't "see" other side

# TCP 3-way handshake

#### Client state

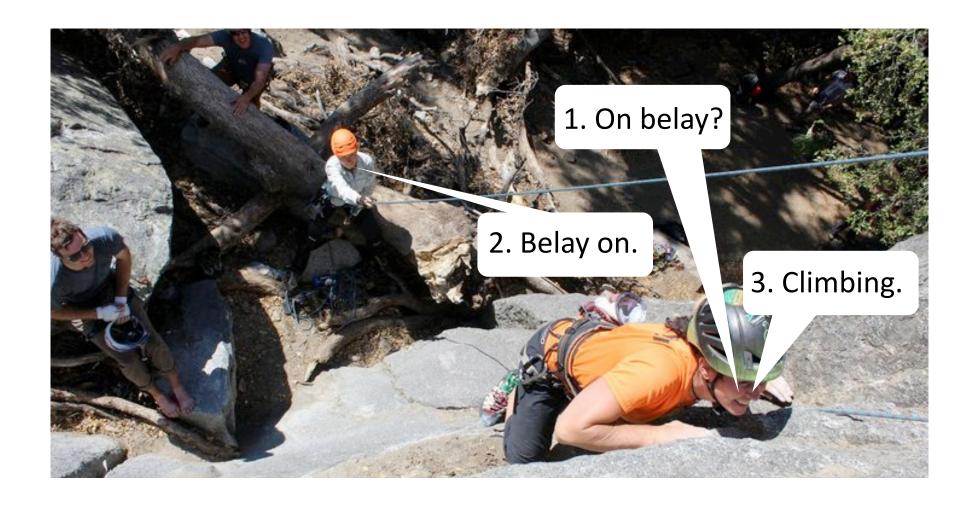

serverSocket.listen(1) clientSocket = socket(AF\_INET, SOCK\_STREAM) LISTEN clientSocket.connect((serverName, serverPort) choose init seq num, x send TCP SYN msq **SYNSENT** SYNbit=1, Seq=x choose init seq num, y send TCP SYNACK msg, acking SYN SYNbit=1, Seq=y ACKbit=1; ACKnum=x+1 received SYNACK(x) indicates server is live; **ESTAB** send ACK for SYNACK; this segment may contain ACKbit=1, ACKnum=y+1 client-to-server data received ACK(y) indicates client is live

#### Server state

```
serverSocket = socket(AF INET, SOCK STREAM)
serverSocket.bind(('', serverPort))
connectionSocket, addr = serverSocket.accept()
                  LISTEN
               SYN RCVD
                   ESTAB
```

Transport Layer: 3-23

# A human 3-way handshake protocol

# Closing a TCP connection

- client, server each close their side of connection
  - send TCP segment with FIN bit = 1
- respond to received FIN with ACK
  - on receiving FIN, ACK can be combined with own FIN
- simultaneous FIN exchanges can be handled
